Base paper reimplementation

Two RL control papers, reimplemented on the official BSM1 wastewater benchmark

Paper 1: MAACC — Wang et al., IEEE T-II 2026
Paper 2: floating DO by DDPG — Du et al., Sci China 2023

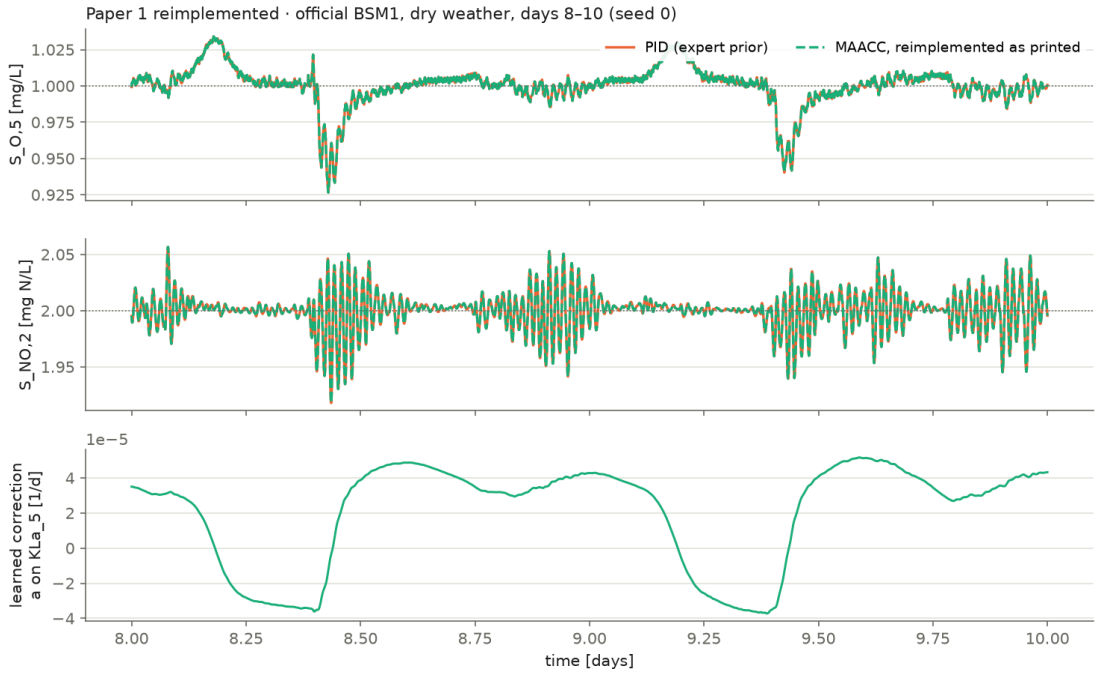

Paper 1 — MAACC

- Paper: oxygen error −95%, nitrate −74% vs PID
- Ours, exactly as printed (Table I, 20 runs): **MAACC = PID** in all 180 runs
- Verdict: **not reproducible from the paper as printed**

Official BSM1 plant and influent, algorithm and Table I values as printed, mean of 20 runs. Up = MAACC better than PID. Reimplemented, MAACC equals PID.

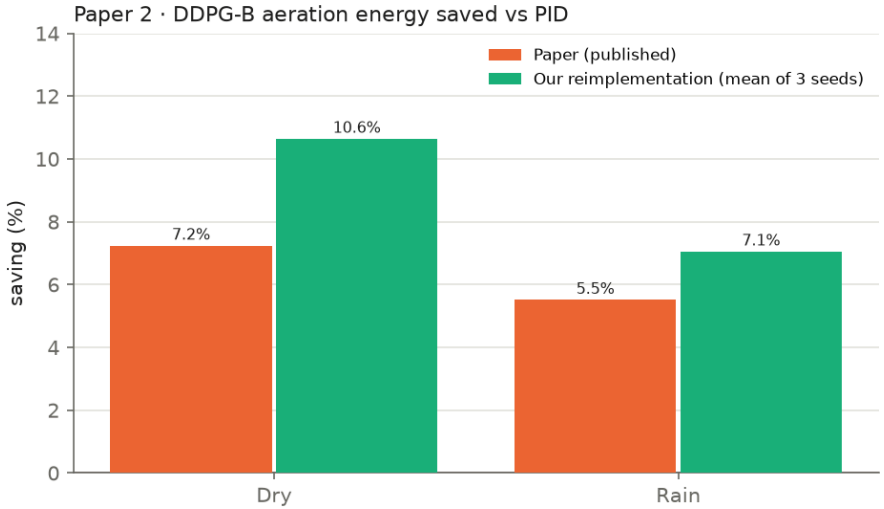

Paper 1 — why

Learned correction stays ~10^{-5}, so MAACC sits on the PID line

Paper 2 — floating DO

- PID & fuzzy match the paper within 1%
- DDPG-B saves 10.6% dry / 7.1% rain (paper 7.2 / 5.5)
- Not in paper: ammonia over limit 56% vs 21% (PID)

Conclusion

- Paper 1: not reproducible as printed
- Paper 2: reproduced in direction, size depends on seed
- All results: github.com/Amritha902/water_resource
